

Hospital Management Data Analysis Project

By: Roshan Nikam

1. Introduction

This project focuses on analysing hospital operations using data from various departments including doctors, patients, appointments, billing, and treatments. The goal was to process, query, and visualize the data to uncover actionable insights to support healthcare decisions and improve hospital efficiency.

2. Project Objectives

- Import and manage hospital data using PostgreSQL (pgAdmin).
 - Execute complex SQL queries for data analysis.
 - Visualize the queries and KPIs using Power BI and Python.
 - Build an interactive dashboard for quick decision-making.
 - Identify patterns, inefficiencies, and revenue metrics.
-

3. Tools & Technologies Used

Tool	Purpose
pgAdmin	Data storage, SQL queries
Power BI	Dashboards, data visualization
Python	Data cleaning, advanced charts
Pandas	SQL processing in Python
Seaborn/Matplotlib	Data plots

4. Dataset Overview

worked with 5 datasets in CSV format:

File Name

doctors.csv

patients.csv

appointments.csv

billing.csv

treatment.csv

5. Data Preparation and Import

- CSV files were imported into PostgreSQL using pgAdmin.
- Tables were cleaned and relationships were created using foreign keys (e.g., patient ID in billing linked to patients).
- Data types were cast properly (dates, numeric fields, etc.).
- Null values were handled during import.
- Added new columns and created measures in powerbi

6. SQL Querying using pgAdmin

Performed SQL analysis using PostgreSQL. Key queries included:

- Total appointments were made per doctor
- patients have the highest number of appointments
- trend of appointments over the last 12 months
- How many appointments were completed, cancelled, or pending
- total billing amount generated per month
- doctor generates the most revenue
- average billing amount per treatment type
- percentage of billing is overdue or unpaid
- patients received each type of treatment
- average cost associated with each treatment
- revenue by each treatment

- doctors have the highest number of appointments
- average appointment time per doctor
- revenue generated by each doctor
- do patients revisit the hospital
- percentage of patients have multiple treatments
- seasonal patterns in patient visits or treatments

Example Query:

```
SELECT d.name AS doctor_name, COUNT(a.appointment_id) AS total_appointments
FROM appointments a
JOIN doctors d ON a.doctor_id = d.doctor_id
GROUP BY d.name;
```

7. Power BI Dashboard

- Imported SQL data into Power BI.
- Created dynamic and interactive dashboards with slicers for:
 - Reason for visit
 - Treatment type

Power BI Visuals:

- Bar Chart: doctors attended patients
 - Line Chart: Monthly appointments
 - Pie Chart: Payment Status
 - Donut chart: Appointment status
 - Table: Patient revisit
 - Total revenue
 - Total patients
 - Gender distribution
-

8. Python Visualizations

Used Python to create additional insights and visualizations using Pandas, Matplotlib, and Seaborn.

Visuals Created:

- Bar plot's
- Pie chart
- Tables
- line graph
- Example Python Code:

```
import pandas as pd

import seaborn as sns

import matplotlib.pyplot as plt

query1=""" SELECT d.name AS doctor_name, COUNT(a.appointment_id) AS
total_appointments
FROM appointments a
JOIN doctors d ON a.doctor_id = d.doctor_id
GROUP BY d.name;"""

df = pd.read_sql("query1, engine")

sns.barplot(data=df, x='department', y='total_charges')

plt.title("Billing Charges by Department")

plt.show()
```

9. Key Insights & Results

- Highest patient traffic is in the **Chemotherapy** and **X-Ray treatment**.
- **25% Appointment Cancelled**
- Doctor **Dr. Sarah Taylor** had the highest number of patients.
- **Quarter two of the year and first month** had peak appointment bookings.

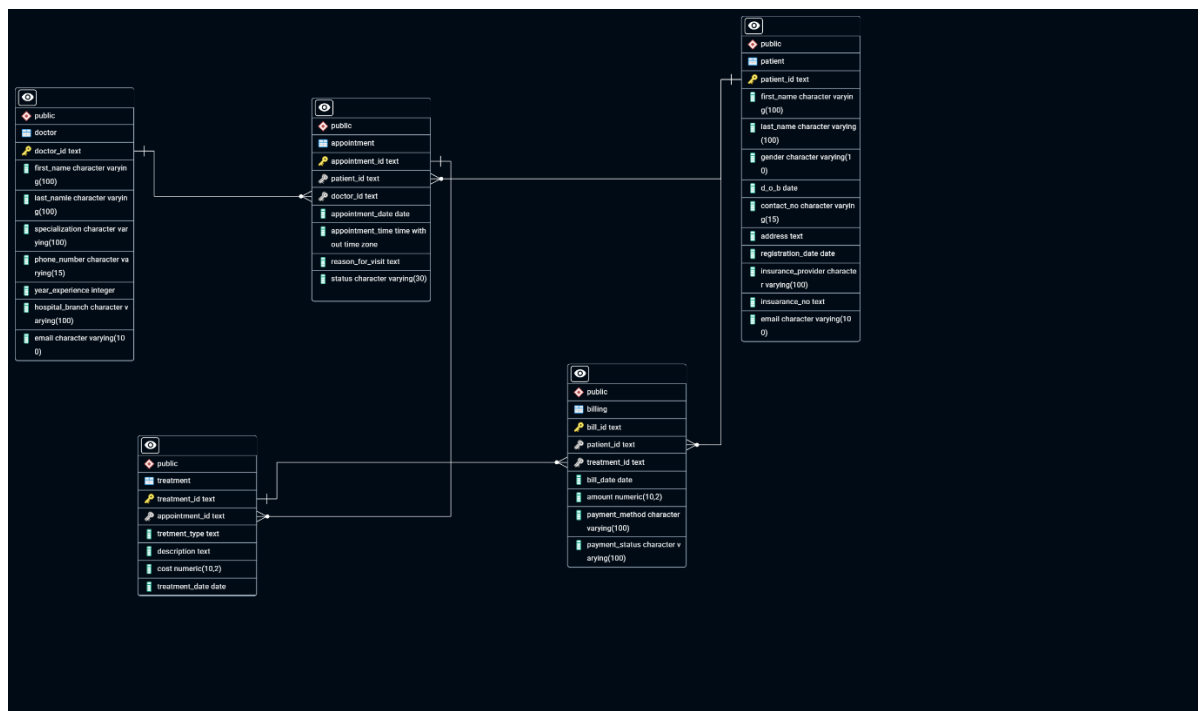

- **34%** billing amount pending and **33%** bill failed.
- Generated most revenue in **first month**.
- **16-time** one patient took appointments.
- Generated most revenue in **MRI treatment type**.
- **38 %** received payment by **credit card**
- **10-time** one patient visited to hospital.

11. Conclusion

The project effectively demonstrated how hospital data can be transformed into insights through SQL, Power BI, and Python. The dashboards and visualizations provide a useful analytical tool for hospital administrators to monitor operations and improve service delivery.

14. Appendix

- **ERD**

- SQL Query Snapshots

```

1  --- create table Doctor
